

1. Create a MySQL Database and Table (Separate File)
2. Install Tomcat (Separate File)
3. Run Android App in the local network on Emulator

TempCheckr is an app that allows the user to check the 7 day forecast and search history based on location input.

Features

- Uses weather api to get data
- Will check if the user is entering correct data
- Upon entering "Get Weather", the app will call the servlet, which calls the database, to save search history to the database
- The search history pulls data from the database using the servlet
